Introduction

There are a growing number of nationally and internationally approved standard methods relating to monitoring speciated volatile organic compounds (VOCs) in air. They are generated by relevant government agencies (US EPA, UK HSE, etc.), international standards agencies such as ISO and CEN, or consensus-based standards organisations such as ASTM.

Key issues to consider when reviewing and selecting appropriate standards are:

- Method scope – e.g. ambient, indoor, workplace, materials emissions test chambers
- Sampling and analytical requirements
- Method format
  - ‘Recipe’
  - General guidance (e.g. appropriate choice of sorbents, selection of suitable GC column)
- Validation protocol
- Method limits – list of target analytes (if applicable), concentration range, detection limits, analyte volatility range, etc.

Generally speaking, methods written in ‘recipe’ format are restrictive both with respect to the analytical technology available at the time they were published, and the cost of use, e.g. requiring calibration for the entire target analyte set in situations where only two or three specific compounds are of interest.

A summary listing of key national and international standards is presented here – please contact the relevant organisation directly for information about how to obtain copies of standards.

US Environmental Protection Agency (EPA)

Website: [http://www.epa.gov](http://www.epa.gov)

Air Toxics Information (TO-1, TO-2, TO-17 etc.):
[http://www.epa.gov/ttn/amtic/airtox.html](http://www.epa.gov/ttn/amtic/airtox.html)

TO-1: Method for the determination of volatile organic compounds in ambient air using Tenax adsorption and gas chromatography/mass spectrometry.

TO-2: Method for the determination of volatile organic compounds in ambient air by carbon molecular sieve adsorption and gas chromatography/mass spectrometry.

TO-14: The determination of volatile organic compounds (VOCs) in ambient air using SUMMA passivated canister sampling and gas chromatographic analysis.

TO-15: The determination of volatile organic compounds (VOCs) in air collected in SUMMA canisters and analysed by gas chromatography/mass spectrometry.

TO-17: Determination of volatile organic compounds in ambient air using active sampling onto sorbent tubes.

Method 25A: Determination of total gaseous organic concentration using a flame ionization analyzer.

Method 311 (thermal desorption variant: work in progress): Analysis of hazardous air pollutant compounds in paints and coatings by direct injection into a gas chromatograph.

N.B. US EPA methods for the analysis of VOCs in water and soil by purge-and-trap – e.g. 502.1, 602, 524 and 624 – also specify analysis by thermal desorption and gas chromatography.
European Committee for Standardization (CEN)

Standard methods generated by CEN typically specify performance criteria against which the suitability of an analytical method can be assessed. CEN is associated with the International Standards Organisation (ISO), and copies of CEN standards may be obtained from National Standards Organisations worldwide.

Note that CEN and ISO standards may now each be re-issued as the other without extensive review, under the so-called ‘Vienna Agreement’.

**EN 482**: Workplace atmospheres – General requirements for the performance of procedures for the measurement of chemical agents.

**EN 689**: Guidelines for the assessment of exposure by inhalation to chemical agents for comparison with limit values and measurement strategy.

**EN 838**: Workplace atmospheres – Diffusive samplers for the determination of gases and vapours – Requirements and test methods.

**EN 1076**: Workplace atmospheres – Requirements and test methods for pumped sorbent tubes for the determination of gases and vapours.

**EN 1232**: Workplace atmospheres – Pumps for personal sampling of chemical agents – Requirements and test methods.

**EN 13528**: Ambient Air Quality – Diffusive samplers for the determination of concentrations of gases and vapours. Requirements and test methods.

**EN 13529**: Ambient Air Quality – Diffusive samplers for the determination of concentrations of gases and vapours. Guide for selection, use and maintenance.

**ENV 13419**: Building products – Determination of the emission of volatile organic compounds.

- **Part 1**: Emission test chamber method (superseded by EN ISO 16000-9).
- **Part 2**: Emission test cell method (superseded by EN ISO 16000-10).
- **Part 3**: Procedure for sampling, storage and preparation of test specimens (superseded by EN ISO 16000-11).
- **Part 4**: Not approved by CEN. See ISO 16000-6.

**EN ISO 16000**: Indoor Air

- **Part 9**: Emission test chamber.
- **Part 10**: Emission test cell method.
- **Part 11**: Procedure for sampling, storage of samples and preparation of test specimens.

**EN 13999**: Adhesives – Short term method for measuring the emission properties of low-solvent or solvent-free adhesives after application.

- **Part 1**: General procedure.
- **Part 2**: Determination of volatile organic compounds.

**EN 14662**: Ambient air quality – Standard method for the measurement of benzene concentrations.

- **Part 1**: Pumped sampling followed by thermal desorption and gas chromatography method.
- **Part 4**: Diffusive sampling followed by thermal desorption and gas chromatography.

**EN ISO 16017**: Air quality – Sampling and analysis of volatile organic compounds in ambient air, indoor air and workplace air by sorbent tube/thermal desorption/capillary gas chromatography.

- **Part 1**: Pumped sampling.
- **Part 2**: Diffusive sampling.

**prEN 15052**: Resilient, textile and laminate floor coverings – Evaluation and requirements of volatile organic compounds (VOC) emissions.

**prEN 13649**: Stationary source emissions – Determination of the mass concentration of individual gaseous organic compounds.
The International Standards Organization (ISO)

Website: [http://www.iso.org/iso/home/standards.htm](http://www.iso.org/iso/home/standards.htm)

(EN) **ISO 16017**: Air quality – Sampling and analysis of volatile organic compounds in ambient air, indoor air and workplace air by sorbent tube/thermal desorption/capillary gas chromatography.
- Part 1: Pumped sampling.
- Part 2: Diffusive sampling.

**ISO 16000**: Indoor Air
- Part 1: General aspects of sampling strategy.
- Part 5: Sampling strategy for VOCs.
- Part 6: Determination of VOCs in indoor and chamber air by active sampling on Tenax TA, thermal desorption & gas chromatography MSD/FID.
- Part 9: Emission test chamber.
- Part 10: Emission test cell method.
- Part 11: Procedure for sampling, storage of samples and preparation of test specimens.

**ISO DIS 16000**: Part 24: Performance test for evaluating the reduction of volatile organic compounds and carbonyl compounds without formaldehyde concentrations by sorptive building materials.

**ISO CD 12219-1**: Road vehicles

**ISO 16107**: Workplace atmospheres – Protocol for evaluating the performance of diffusive samplers.

**ISO/FDIS 15009**: Soil Quality
- GC determination of the content of volatile aromatic hydrocarbons, naphthalene and volatile halogenated hydrocarbons – Purge and trap method with thermal desorption.

The American Society for Testing and Materials (ASTM)

- **D5116-05**: Standard guide for small-scale environmental chamber determinations of organic emissions from indoor materials/products.
- **D5466-95**: Standard test method for determination of volatile organic chemicals in atmospheres (canister sampling methodology).
- **D6177-97**: Standard practice for determining emission profiles of volatile organic chemicals emitted from bedding sets.
- **D6196-03**: Standard practice for selection of sorbents, sampling and thermal desorption analysis procedures for volatile organic compounds in air.
- **D6246-01**: Standard practice for evaluating the performance of diffusive samplers.
- **D6330-98**: Standard practice for the determination of volatile organic compound (excluding formaldehyde) emissions from wood-based panels using small environmental chambers under defined test conditions.
- **D6345-98**: Standard guide for selection of methods for active, integrative sampling of volatile organic compounds in air.
- **D6399-99a**: Standard guide for selecting instruments and methods for measuring air quality in aircraft cabins.
- **D6670-01**: Standard practice for full-scale chamber determination of volatile organic emissions from indoor materials/products.
- **D6803-02**: Standard practice for testing and sampling of volatile organic compounds (including carbonyl compounds) emitted from paint using small environmental chambers.
- **D7143-05**: Emission cells for the determination of VOCs from indoor materials/products.
- **D7339**: Test method for determination of volatile organic compounds emitted from carpet using a specific sorbent tube and thermal desorption/gas chromatography.

**WK proposed**: Standard practice for: Micro-scale test chambers for screening vapor-phase organic emissions from materials/products.
The following methods have been validated by the UK Health & Safety Laboratory:

**MDHS 2**: Acrylonitrile in air. Laboratory method using porous polymer adsorbent tubes and thermal desorption with gas chromatographic analysis (March 1981).

**MDHS 3**: Generation of test atmospheres of organic vapors by the syringe injection technique. Portable apparatus for laboratory and field use (March 1981).

**MDHS 22**: Benzene in air. Laboratory method using porous polymer adsorbent tubes, thermal desorption and gas chromatography (March 1983).

**MDHS 23**: Glycol ether and glycol acetate vapors in air. Laboratory method using Tenax™ sorbent tubes, thermal desorption and gas chromatography (revised March 1988).

**MDHS 27**: Protocol for assessing the performance of a diffusive sampler (June 1987).

**MDHS 33**: Adsorbent tube standards. Preparation by the syringe technique loading (December 1987).

**MDHS 33/2**: Sorbent tube standards. Preparation by the syringe technique (February 1997).

N.B. This procedure describes the preparation of sorbent tube standards to be used for calibration, determination of desorption efficiency and quality control in connection with sorbent tube/gas chromatographic methods for the determination of the time-weighted average concentrations of volatile organic compounds in workplace air. This method is suitable for a wide variety of volatile organic compounds.

**MDHS 40**: Toluene in air. Laboratory method using pumped porous polymer adsorbent tubes, thermal desorption and gas chromatography (June 1984).

**MDHS 43**: Styrene in air. Laboratory method using porous polymer diffusive samplers, thermal desorption and gas chromatography (March 1985).

**MDHS 50**: Benzene in air. Laboratory method using porous polymer diffusion samplers, thermal desorption and gas chromatography (October 1985).

**MDHS 53/2**: 1,3-Butadiene in air. Laboratory method using pumped samplers, thermal desorption and gas chromatography (revision in press).

**MDHS 54**: Protocol for assessing the performance of a pumped sampler for gases and vapors (August 1986).

**MDHS 55**: Acrylonitrile in air. Laboratory method using porous polymer diffusion samplers, thermal desorption and gas chromatography (June 1986).

**MDHS 60**: Mixed hydrocarbons (C_2 to C_10) in air. Laboratory method using pumped porous polymer and carbon sorbent tubes, thermal desorption and gas chromatography (December 1987).

**MDHS 63/2**: 1,3-Butadiene in air. Laboratory method using diffusive samplers, thermal desorption and gas chromatography (revision in press).

**MDHS 66**: Mixed hydrocarbons (C_5 to C_10) in air. Laboratory method using porous polymer diffusion samplers, thermal desorption and gas chromatography (November 1989).

**MDHS 70**: General methods for sampling airborne gasses and vapors (October 1990).

N.B. This method deals with the collection and analysis of gases and vapours commonly found in the workplace environment. It is limited to descriptions of sampling methods for subsequent laboratory analysis. It does not, therefore, include any discussions of direct reading instruments, colorimetric indicators, tape samplers, and other “on the spot” testing devices.

**MDHS 71**: Analytical quality in workplace air monitoring (March 1991).

N.B. This MDHS is intended to provide guidance to laboratories on the practical application of internal quality control procedures within the laboratory, although it also includes some information on external quality assessment. It is not intended to be exhaustive, nor does it set down detailed requirements for the operation of quality control schemes in particular laboratories.

**MDHS 72**: Volatile organic compounds in air. Laboratory method using pumped solid sorbent tubes, thermal desorption and gas chromatography (February 1992).

N.B. This method is suitable for the measurement of the airborne concentrations of individual compounds and of components of volatile organic mixtures. It recommends a number of different sorbents for use in the sample tube, which are appropriate for different ranges of volatile organic compounds. Breakthrough volumes and safe sampling volumes are given for a range of components and sorbents.

**MDHS 80**: Volatile organic compounds in air. Laboratory method using diffusive solid sorbent tubes, thermal desorption and gas chromatography (August 1995).

N.B. This method is suitable for the measurement of the airborne concentrations of individual compounds and of components of volatile organic mixtures. It recommends a number of different sorbents for use in the sample tube, which are appropriate for different ranges of volatile organic compounds. Uptake rates are given for a range of components and sorbents.

**MDHS 89**: Dimethyl sulphate and diethyl sulphate in air. Laboratory method using thermal desorption, gas chromatography–mass spectrometry (March 1998).
US National Institute for Occupational Safety and Health (NIOSH)
