As Headspace-Vials have to withstand high internal pressure, all illustrated vials have a wall thickness of 1.2mm. Thus it is guaranteed that the vial will not burst. Contrary to a widely spread opinion the seal - and not the vial - represents the weakest part of the whole system. Under pressure the septa will bulge against the Aluminium Cap with such a force that the cap is torn apart. By own testing we varified that e.g. our vials can easily withstand 10 bars or more, while the seal is torn apart around 10 bars when no pressure release system - like our Headspace Cap - is used.

Aluminium Crimp Seals

For HS2000 + HS850

Magnetic Crimp Seals

For HS250, HS500, HS800

As the liners vary strongly in their total thicknesses, it is essential to use a crimper, that is **adjustable in crimping height** (screw up or down the inner part of the crimping head with a hexagon key) **and in crimping pressure** (Screw in the handle).

overcrimped
Adjust crimping
pressure + crimping
height!

overcrimped

crimping
height!

overcrimped
Adjust crimping
pressure + crimping
height!

In case of overcrimping of Headspace-Caps the bridges of the scorelines suffer and may break open even at low internal pressure (less than 3 bars) or may even tear apart beside the scorelines.
